Coffee Sales Analysis Dashboard | Microsoft Excel

Project Overview: Developed an interactive coffee sales dashboard to analyse revenue performance, hourly sales trends, product demand, category contribution, and store-level performance, transforming sales data into actionable business insights.

Project Insights

Weekly sales performance

Monday recorded the highest daily sales at approximately **100.0K**, followed by Friday at 99.7K, Thursday at 99.0K, and Wednesday at 98.8K. Saturday had the lowest daily sales at 95.3K, indicating a relatively narrow sales range across the week.

Category-level revenue contribution

Coffee was the leading product category, generating approximately 266K in sales, or around 39% of total revenue. Tea contributed another 26%, while Bakery and Drinking Chocolate accounted for approximately 12% and 11%, respectively. Revenue is therefore concentrated in Coffee and Tea, which together represent roughly 65% of sales.

Best-selling product identification

Barista Espresso generated approximately **91.4K in revenue**, making it the top-selling product by sales value in the displayed product ranking. This provides an opportunity to prioritize product availability, evaluate repeat-purchase behaviour, and explore complementary product recommendations.

Store-wise sales comparison

Hell's Kitchen generated approximately **232.9K**, while Lower Manhattan contributed 226.6K and Astoria generated 228.1K. Hell's Kitchen led the three locations, although the relatively small difference suggests that all locations contribute meaningfully to overall revenue.

Hourly sales trend analysis

Hourly sales peaked during the morning period, with approximately 17.7K at 8 AM, 17.8K at 9 AM, and 18.5K at 10 AM. Sales declined after the morning peak and generally remained lower through the afternoon, highlighting an opportunity to align staffing and product availability with time-based demand

Business recommendations

These recommendations turn your dashboard from a reporting exercise into a business decision-making project.

Optimize staffing during peak hours

Schedule sufficient baristas and front-counter staff between 8 AM and 10 AM, when hourly sales reach their highest levels. Review transaction counts and waiting times to validate staffing needs and improve service speed.

Business objective: Reduce waiting time and capture peak-hour demand.

Strengthen the Coffee and Tea categories

Prioritize stock availability for high-contributing categories, particularly Coffee and Tea. Test cross-selling strategies, such as pairing coffee with bakery products, and measure their effect on average order value and category revenue.

Business objective: Protect core revenue and identify opportunities to increase basket value.

Improve product assortment and inventory planning

Investigate low-selling products such as Green Beans by examining sales volume, margins, stock levels, product availability, and customer demand. Adjust replenishment or promotional strategies only after identifying the underlying cause of low sales.
Business objective: Reduce potential overstock and improve inventory efficiency.

Investigate weekday sales variation
Compare sales, order counts, average order value, and staffing costs across weekdays. Since Saturday recorded the lowest sales at 95.3K, test targeted promotions or product bundles if further analysis confirms an opportunity to improve performance.
Business objective: Improve weaker trading periods without unnecessarily discounting strong days.

Benchmark store performance
Compare all three stores using revenue, transactions, average transaction value, product mix, and profit margin. Investigate why Hell's Kitchen leads revenue and assess whether successful practices can be replicated at Astoria and Lower Manhattan.
Business objective: Identify transferable operating practices and store-level growth opportunities.
